说明

ISO7421A-Q1 按照 UL 标准，在 1 分钟内提供高达 2.5 kVrms 的电流隔离。这个数字隔离器有两条具有双向通道配置的隔离通道。每个隔离通道都有一个由二氧化硅 (SiO₂) 绝缘隔栅分开的逻辑输入和输出缓冲器。通过与隔离电源一起使用，这些器件可防止数据总线或者其它电路上的噪音电流进入本地接地并干扰或者损坏敏感电路。

此器件有 TTL 输入阈值并要求两个介于 3V 和 5.5V 之间的电源电压，或者任一组合。当由一个 3V 电源供电时，所有输入为 5V 耐压。

NOTE

Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance.

Creepage and clearance on a printed-circuit board become equal according to the measurement techniques shown in the Isolation Glossary. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.

LIFE EXPECTANCY versus WORKING VOLTAGE

G001

Figure 4. Life Expectancy versus Working Voltage

IEC SAFETY LIMITING VALUES

Safety limiting intends to prevent potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_S Safety input, output, or supply current	$\theta_{JA} = 212^\circ\text{C}/\text{W}$, $V_I = 5.5$ V, $T_J = 170^\circ\text{C}$, $T_A = 25^\circ\text{C}$			112	mA
	$\theta_{JA} = 212^\circ\text{C}/\text{W}$, $V_I = 3.6$ V, $T_J = 170^\circ\text{C}$, $T_A = 25^\circ\text{C}$			171	
T_S Maximum case temperature				150	$^\circ\text{C}$

The safety-limiting constraint is the absolute-maximum junction temperature specified in the *Absolute Maximum Ratings* table. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the *Thermal Characteristics* table is that of a device installed in the JESD51-3, Low-Effective-Thermal-Conductivity Test Board for Leaded Surface-Mount Packages and is conservative. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
