

CMT8100, CMT8101 High Reliability Bidirectional I2C Isolators

Features

- Up to 5000 Vrms insulation voltage
- I2C Clock rate: up to 2 MHz
- Power supply voltage: 2.5 V to 5.5 V
- AEC-Q100 Grade 1 qualified
- High CMTI: 150 kV/us
- Chip level ESD: HBM: ± 8 kV
- High system level EMC performance:
 - Enhanced system level ESD, EFT, surge immunity
- Isolation barrier life: > 60 years
- Low power consumption: 1.5mA/ch (1 Mbps)
- Low propagation delay: <15 ns
- Operation temperature: $-40^{\circ}\text{C} \sim 125^{\circ}\text{C}$
- RoHS-compliant packages:
 - SOIC-8 narrow body
 - SOIC-16 wide body
- Safety regulatory approvals
 - UL recognition: up to 5000 Vrms for 1 minute per UL1577
 - CQC certification per GB4943.1-2011
 - CSA component notice 5A
 - DIN VDE V 0884-11:2017-01

Applications

- Power over Ethernet
- Isolated I2C, SMBus, or PMBus interface
- I2C level shifting
- Battery management

Description

The (CMT8100, CMT8101) devices are high reliability bidirectional isolators that are compatible with I2C interface. The CMT810X devices are AEC-Q100 qualified. The CMT810X devices are safety certified by UL1577 supporting several insulation withstand voltages (3.75 kVrms, 5 kVrms), while providing high electromagnetic immunity and low emissions at low power consumption. The I2C clock of the CMT810X is up to 2 MHz, and the common-mode transient immunity (CMTI) is up to 150 kV/us. Wide supply voltage of the CMT810X devices supports to connect with most digital interfaces directly, easy to do the level shift. High system level EMC performance enhances device reliability and stability.

3.2 PCB Layout Guidelines

The CMT810X requires a 0.1 µF bypass capacitor between VDD1 and GND1, VDD2 and GND2. The capacitor should be placed as close as possible to the package. The figure below shows the recommended PCB layout. Make sure the space under the chip should keep free from planes, traces, pads and via. The pull-up resistors are required for both side 1 and side 2 buses. And the value of the resistors depends on the number of I2C devices on the bus.

6 Function Description

6.1 Function Overview

The CMT810X is a bidirectional isolator based on a capacitive isolation barrier technique. The CMT810X devices are compatible with I2C interface. Internally, the I2C interface is split into two unidirectional channels communicating in opposite directions via a dedicated capacitive isolation channel for each. The digital signal is modulated with RF carrier generated by the internal oscillator at the Transmitter side. Then it is transferred through the capacitive isolation barrier and demodulated at the Receiver side.

The CMT8100 devices are high reliability dual-channel bidirectional isolators for clock and data lines while CMT8101 has a bidirectional data and a unidirectional clock channel. The CMT8100 is suitable for multi-master application while CMT8101 is useful in a single master application.

The side 2 logic levels of CMT810X are standard I2C value, and the maximum load for side 2 is ≤ 400 pF. So multiple CMT810X devices connected to a bus by their Side 2 pins can communicate with each other and with other I2C compatible devices.

The side 1 logic levels of CMT810X are not standard value. The output low level of CMT810X is 650mV, while low-level output voltage to high-level input voltage threshold is 50 mV. This prevents an output logic low at Side 1 being transmitted back to Side 2 and pulling down the I2C bus.

The CMT810X devices are AEC-Q100 qualified. The CMT810X device is safety certified by UL1577 support several insulation withstand voltages (3.75 kVrms, 5 kVrms), while providing high electromagnetic immunity and low emissions at low power consumption. The I2C clock of the CMT810X is up to 2 MHz, and the common-mode transient immunity (CMTI) is up to 150 kV/us. Wide supply voltage of the CMT810X device supports to connect with most digital interfaces directly, easy to do the level shift. High system level EMC performance enhances reliability and stability.

The table below shows the functional status of CMT810X. The CMT810X is high impedance output when VDDIN is unready and VDDOUT is ready as shown in the table below.

Table 12. Output Status vs. Power Status

Input	VDD1 Status	VDD2 Status	Output	Comment
H	Ready	Ready	Z	Normal operation.
L	Ready	Ready	L	
X	Unready	Ready	Z	The output follows the same status with the input within 60 us after input side VDD1 is powered on.
X	Ready	Unready	X	The output follows the same status with the input within 60 us after output side VDD2 is powered on.
